

Acronis[®] Snap Deploy[®] 2.0 for Servers

All private and public sector organizations (businesses, schools, federal/state/local governments, etc.) face increasing challenges when configuring and deploying new servers in a distributed environment. Having a deployment solution that enables them to use a standard configuration for a new machine will significantly decrease support expenses.

Key Features:

- Deploy to different hardware with Acronis Universal Deploy
- Bootable media builder lets you create ISO's and Microsoft Remote Installation Service (RIS) packages
- 64-bit Windows[®] support
- Customizable deployment options
- Enhanced PXE server
- Management Console — manages deployments from one central location
- Multicasting — minimizes deployment time by sending image simultaneously to multiple machines

Acronis has a solution to address this need. Acronis Snap Deploy Server is a comprehensive deployment solution that enables organizations to deploy new servers quickly and easily. Using disk-imaging technology that creates an image of an entire hard disk drive, including the operating system and all applications, it is ideal for rapid bare-metal installations of servers.

Deploy a Server with Acronis Snap Deploy Server in 4 Easy Steps:

1. Create a standard configuration image, including the operating system, applications, and other settings.
2. Create bootable media (diskette or CD, ISO image, RIS boot package or configure a Preboot Execution Environment (PXE) with Acronis Snap Deploy Server agents).
3. Boot the bare servers you want to deploy with the bootable media, or PXE, enabling the bare systems to connect to the main deployment server.
4. Follow wizard-driven GUI on Management Console to select a template or create a new template for the deployment.
5. The OS Deploy server commences deployment of the golden image to the bare systems. No installation of the operating system or applications is required - the image contains everything the system needs to run

FEATURES	BENEFITS
Acronis Universal Deploy¹	Ensure that your new systems will boot by allowing you to add drivers and create templates for specific hardware
Bootable media builder	Facilitate deployment by providing more options for creating bootable media. You can create ISOs, Microsoft Remote Installation Service (RIS) packages, and place multiple configurations on one CD
64-Bit Windows® Support	Deploy both new and older systems using one solution
Customizable deployment options	Maximize the performance of new machines by allowing partitions to be resized. Ensure that machines are properly deployed by providing options to reboot or shutdown after the master image is applied
Enhanced PXE server	Create a PXE server more easily by specifying default configurations and timeout parameters for rebooting new systems
Disk imaging deployment	Fast deployment of new systems because the product enables users to create an image of a system that includes the operating system and applications
Pre-deployment utilities	Easily configure system settings such as network settings, domain/workgroup settings, computer name, user name, and Security Identifier (SID), by applying them to an image before deployment
Multicasting	Minimize deployment time by sending image simultaneously to multiple machines
Create standard system configurations by creating an image and saving it	Save maintenance expenses by having ready-to-use configurations for new deployments
Wizard-driven Graphical User Interface (GUI)	Easy to use
Logs view	Quickly troubleshoot deployment issues
Deploy images created with Acronis True Image	Use backup images created by Acronis True Image to create standard configurations without having the product installed

Acronis® Snap Deploy® 2.0 System Requirements

Operating systems for deployment²

Windows® 2003 Server / 2000 Server / 2000 Advanced Server / NT 4.0 Server

¹ Acronis Universal Deploy requires a separate add-on license.

² Can deploy any OS on an x86-based system with bootable media.
